

accessify

see the barriers before your customers do.

A black wheelchair is shown from a side-rear perspective, wedged between a concrete curb and a sidewalk. The wheelchair's large rear wheels are on the sidewalk, while the front casters and the lower part of the frame are caught on the edge of the curb. The background is a blurred outdoor setting with some greenery and a building.

95%

of buildings are not
compliant with ADA
accessibility requirements

73%

of buildings fail attempts
to be compliant

**EVEN THEN,
COMPLIANCE ≠
ACCESSIBILITY**

status quo

Compliance Checklists

- Minimum legal requirements
- Do not reflect real user experience
- Can miss day-to-day barriers

Manual Audits

- Slow and expensive
- Done only occasionally
- Problems remain outdated or undocumented, as they are pre-recorded

Complaints/Legal Action

- Depend on users noticing and reporting issues
- Not instant or easy to act on
- Expensive

There is **NO** fast, universal,
and practical way to identify
and simulate real-world
accessibility barriers within a
building.

accessify

see the barriers before your customers do.

instantly turn a single photo into an AI-powered
interactive and editable 3D simulation that reveals
how people with disabilities experience a space

here's how it works

accessify: AI-POWERED ACCESSIBILITY INSIGHTS

Accurate: See a 3D-model version of your 2D picture of the space with pins on problematic areas

Instant: Upload one photo and receive a full accessibility analysis in seconds.

Human-Centered Simulations: Simulates how blind users, wheelchair users and other individuals navigate the space.

Live Edits: Suggests additions and edits to the space, and displays them and their effects on the simulation in real time

how it works: 3D Model + Insight Generation

1

Upload a Space

User uploads a photo or scan of a room, hallway, entrance, or building area.

2

Generate 3D Environment

- Accessify converts the input into a 3D model that represents the real space.

3

Gemini Generates Insights

- Gemini analyzes the environment and identifies accessibility issues, risks, and improvement suggestions.

how it works: Accessibility Simulation

1

Add Accessibility Agents

Accessify places simulated users into the 3D space, such as wheelchair users or people with mobility challenges.

2

Run Movement Simulation

- The agents attempt to navigate paths, entrances, turns, obstacles, and key areas.

3

Flag Real Barriers

- Accessify detects where users get blocked, slowed down, or forced into unsafe routes.
